

Uterus Disease Prediction

Department of Gynecology and Women's Health

Date: 12 Jun 2026

PATIENT INFORMATION

Patient ID: 35

Name: Arya

Age: 34

BMI Status: Overweight

Final Diagnosis: Fibroid

CLINICAL ASSESSMENT REPORT

CLINICAL FINDINGS

The patient has been diagnosed with a fibroid, a type of uterine condition characterized by the growth of non-cancerous tumors in the uterus. Given the patient's overweight status, it is essential to note that excess weight may exacerbate symptoms such as abdominal bloating and may also influence overall health and disease management. The patient's symptoms of abdominal bloating and abnormal vaginal discharge are consistent with the diagnosed condition. The overweight status may also impact the patient's overall health, increasing the risk of other health issues, and potentially affecting the management of the fibroid.

CLINICAL INTERPRETATION

The diagnosis of a fibroid indicates that the patient has a non-cancerous growth in the uterus, which can cause a range of symptoms, including abdominal bloating and abnormal vaginal discharge. This condition can often be managed with appropriate treatment and lifestyle modifications.

RECOMMENDATIONS

To manage the diagnosed condition and improve overall health, it is recommended that the patient adopts a healthy lifestyle, including a balanced diet and regular exercise to achieve a healthy weight. A diet rich in fruits, vegetables, and whole grains, and low in processed foods and sugars, is advised. Follow-up consultations are necessary to monitor the condition and adjust treatment as needed. Further evaluation, such as imaging studies, may be required to assess the size and location of the fibroid and to guide treatment decisions.
